

GITHUB

GITHUB is a web-based platform used for storing, managing, and collaborating on software projects. It is built around a system called GIT, which tracks changes to files over time.

- * GIT = the version control system (tracks changes in code/files)
- * Github = the online service that hosts Git repositories and adds collaboration tools

Code storage

Developers upload projects (“repositories” or “repos”) so they can access them anywhere and keep a history of changes.

Collaboration

Multiple people can work on the same project at the same time using:

- * branches
- * pull requests
- * code reviews
- * issue tracking

Open-source software

Many public projects are hosted there, including:

- Visual Studio Code
- React

- TensorFlow

Portfolio and learning

Developers use GitHub to:

- showcase projects
- contribute to open source
- learn from other people' s code
- build a résumé for tech jobs

Common GitHub terms

- **Repository (repo):** a project folder with version history
- **Commit:** a saved change
- **Branch:** a separate line of development
- **Pull request (PR):** a request to merge changes
- **Fork:** your own copy of someone else' s project

Example workflow

A programmer might:

1. Create a repo
2. Write code
3. Commit changes
4. Push to GitHub
5. Collaborate with teammates through pull requests

Who owns GitHub?

GitHub is owned by Microsoft.
